TYPES SN54100, SN74100 8-BIT BISTABLE LATCHES

DECEMBER 1972 - REVISED DECEMBER 1983

 Dependable Texas Instruments Quality and Reliability

description

These latches are ideally suited for use as temporary storage for binary information between processing units and input/output or indicator units. Information present at a data (D) input is transferred to the Q output when the enable (G) is high and the Q output will follow the data input as long as the enable remains high. When the enable goes low, the information (that was setup at the data input at the time the transition occurred) is retained at the Q output until the enable is permitted to go high.

These circuits are completely compatible with all popular TTL families. All inputs are diode-clamped to minimize transmission-line effects and simplify system design. Typical power dissipation is 40 milliwatts per latch.

The SN54100 is characterized for operation over the full military temperature range of \sim 55° to 125°C; the SN74100 is characterized for operation from 0°C to 70°C.

NOTES: 1. Voltage values, except interemitter voltage, are with respect to network ground terminal.

 Or one set on the voltage between two emitters of a multiple-emitter input transistor. For this circuit, this rating applies between the enable and D inputs of any latch.
